Visitor Kiosk

Design challenge

Brief

Many organisations still use pen and paper to sign people in when they enter a location. However, this is not a scalable or secure solution. An IT company has started using a white-label visitor management kiosk (Tablet solution). It allows visitors and contractors to check in and check out. The current system **notifies hosts that their visitor has arrived** and **checks if a contractor meets the requirements** set up in the system (have completed training, are approved to be on this location).

The IT company has made a request enhance this solution further. They get a lot of new contractors, and their onboarding/training process is still paper-based. They want to **embed the contractor sign up**, **onboarding and training process inside the check-in flow**. When a contractor signs in, **the Visitor Management System will detect if the contractor is already in the system** and if they have completed their location safety/security training (training only needs to be completed once).

Challenge

We require a solution that will across the check-in screen, sign-up screen and location safety/security training screen.

All screens are for a tablet on 1024px x 768px

The contractor check in fields

- First name
- Last name
- Email
- Mobile number (optional)
- Company
- Host (optional)
- Reason for visit(optional)

The visitor check-in fields

- First name
- Last name
- Email
- Mobile number (optional)
- Host (optional)

The contractor sign-up screen should contain the following fields

Company information

- Company name
- Address
- Postcode
- Suburb
- City
- Country
- Industry (optional)
- Number of employees (optional)

Personal information

- First name
- Last name
- Email
- Mobile number (optional)
- Role (optional)

The location safety/security training screen should contain:

Health & Safety notices

- There have been two recorded cases of COVID at this location. Use facemasks where required and sanitise hands as needed.
- The elevator on L4 is undergoing maintenance; this will be completed by the end of business day

Security section

- I acknowledge that i reviewed the online (or paper only) HIAA Security awareness presentation.
- I understand that I am responsible for protecting electronic information as follows:
  - Locking and logging off (or powering off) my assigned workstation when I leave my work area.
  - Not changing settings assigned to my workstation (desktop or laptop) or any other workstation, which disables security features.
  - Not loading (or downloading) or creating any software on my assigned workstation that has not been authorised by the agency.
  - Following all guidelines regarding the transmission of electronic mail or messaging
  - Reporting any security problems I encounter or observe to my immediate supervisor

Evaluation Criteria:

We will evaluate your design challenge based on the following:

- **Research Methodology & Execution:**
  - Did you validate assumptions using appropriate methods?
  - Crucial: Did you provide a brief rationale explaining why you chose these specific research methods (or why you omitted others)?
- **Demonstrated Strategic Thinking:**
  - Does the solution balance business needs with scalable user experience?
- **User Interface & Experience Design:**
  - Holistic product design and visual execution.
- **Process & Presentation:**
  - Documentation of your workflow and decision-making.
  - Delivery: Submission must include the source Figma file (not just a prototype) to demonstrate layer organisation and component usage.
